## Palindrome Index &gt; Coding

Strings

Algorithms

Easy

problem-solving

Core CS

Problem Solving

## QUESTION DESCRIPTION

Given a string of lowercase letters in the range `ascii[a-z]`, determine the index of a character that can be removed to make the string a **palindrome**. There may be more than one solution, but any will do. If the word is already a palindrome or there is no solution, return `-1`. Otherwise, return the index of a character to remove.

## Example

 **$s = \text{"bcbc"}$** 

Either remove 'b' at index **0** or 'c' at index **3**.

## Function Description

Complete the `palindromeIndex` function in the editor below.

`palindromeIndex` has the following parameter(s):

- string s*: a string to analyze

## Returns

- int*: the index of the character to remove or **-1**

## Input Format

The first line contains an integer  **$q$** , the number of queries.

Each of the next  **$q$**  lines contains a query string  **$s$** .

## Constraints

- $1 \leq q \leq 20$
- $1 \leq \text{length of } s \leq 10^5 + 5$
- All characters are in the range `ascii[a-z]`.

## Sample Input

STDIN	Function
-----	-----
3	$q = 3$
aaab	$s = \text{'aaab'}$ (first query)
baa	$s = \text{'baa'}$ (second query)
aaa	$s = \text{'aaa'}$ (third query)

## Sample Output

```
3
0
-1
```

## Explanation

*Query 1: "aaab"*

Removing 'b' at index **3** results in a palindrome, so return **3**.

*Query 2: "baa"*

Removing 'b' at index **0** results in a palindrome, so return **0**.

*Query 3: "aaa"*

This string is already a palindrome, so return **-1**. Removing any one of the characters would result in a palindrome, but this test comes first.

**Note:** The custom checker logic for this challenge is available [here](#).

## CANDIDATE ANSWER

Language used: C

```

1
2  /*
3   * Complete the 'palindromeIndex' function below.
4   *
5   * The function is expected to return an INTEGER.
6   * The function accepts STRING s as parameter.
7   */
8  int is_palindrome(char *s, int left, int right){
9      while (left < right){
10         if (s[left] != s[right]) {
11             return 0;
12         }
13         left++;
14         right--;
15     }
16     return 1;
17 }
18
19 int palindromeIndex(char* s) {
20     int left = 0;
21     int right = strlen(s)-1;
22
23     while (left < right) {
24         if (s[left] != s[right]) {
25             if (is_palindrome(s, left+1, right)) {
26                 return left;
27             }
28
29             if (is_palindrome(s, left, right - 1)){

problem-solving

Core CS

greatest common divisor

Least Common Multiple

### QUESTION DESCRIPTION

There will be two arrays of integers. Determine all integers that satisfy the following two conditions:

1. The elements of the first array are all factors of the integer being considered
2. The integer being considered is a factor of all elements of the second array

These numbers are referred to as being *between* the two arrays. Determine how many such numbers exist.

#### Example

$a = [2, 6]$

$b = [24, 36]$

There are two numbers between the arrays: **6** and **12**.

$6\%2 = 0$ ,  $6\%6 = 0$ ,  $24\%6 = 0$  and  $36\%6 = 0$  for the first value.

$12\%2 = 0$ ,  $12\%6 = 0$  and  $24\%12 = 0$ ,  $36\%12 = 0$  for the second value. Return **2**.

#### Function Description

Complete the `getTotalX` function in the editor below. It should return the number of integers that are between the sets.

`getTotalX` has the following parameter(s):

- `int a[n]`: an array of integers
- `int b[m]`: an array of integers

#### Returns

- `int`: the number of integers that are between the sets

#### Input Format

The first line contains two space-separated integers,  $n$  and  $m$ , the number of elements in arrays  $a$  and  $b$ .

The second line contains  $n$  distinct space-separated integers  $a[i]$  where  $0 \leq i < n$ .

The third line contains  $m$  distinct space-separated integers  $b[j]$  where  $0 \leq j < m$ .

#### Constraints

- $1 \leq n, m \leq 10$
- $1 \leq a[i] \leq 100$
- $1 \leq b[j] \leq 100$

#### Sample Input

```
2 3
2 4
16 32 96
```

#### Sample Output

**Explanation**

2 and 4 divide evenly into 4, 8, 12 and 16.

4, 8 and 16 divide evenly into 16, 32, 96.

4, 8 and 16 are the only three numbers for which each element of a is a factor and each is a factor of all elements of b.

**CANDIDATE ANSWER**

### QUESTION 3

Needs Review

Score 70

Anagram > Coding Strings Algorithms Easy problem-solving Core CS

#### QUESTION DESCRIPTION

Two words are *anagrams* of one another if their letters can be rearranged to form the other word.

Given a string, split it into two contiguous substrings of equal length. Determine the minimum number of characters to change to make the two substrings into anagrams of one another.

#### Example

$s = \text{abccde}$

Break  $s$  into two parts: 'abc' and 'cde'. Note that all letters have been used, the substrings are contiguous and their lengths are equal. Now you can change 'a' and 'b' in the first substring to 'd' and 'e' to have 'dec' and 'cde' which are anagrams. Two changes were necessary.

#### Function Description

Complete the *anagram* function in the editor below.

*anagram* has the following parameter(s):

- *string s*: a string

#### Returns

- *int*: the minimum number of characters to change or -1.

#### Input Format

The first line will contain an integer,  $q$ , the number of test cases.  
Each test case will contain a string  $s$ .

#### Constraints

- $1 \leq q \leq 100$
- $1 \leq |s| \leq 10^4$
- $s$  consists only of characters in the range `ascii[a-z]`.

#### Sample Input

```
6
aaabbb
ab
abc
mnop
xyyx
xaxbbbxx
```

### Sample Output

```
3
1
-1
2
0
1
```

### Explanation

*Test Case #01:* We split *s* into two strings *S1*='aaa' and *S2*='bbb'. We have to replace all three characters from the first string with 'b' to make the strings anagrams.

*Test Case #02:* You have to replace 'a' with 'b', which will generate "bb".

*Test Case #03:* It is not possible for two strings of unequal length to be anagrams of one another.

*Test Case #04:* We have to replace both the characters of first string ("mn") to make it an anagram of the other one.

*Test Case #05:* *S1* and *S2* are already anagrams of one another.

*Test Case #06:* Here *S1* = "xaxb" and *S2* = "bbxx". You must replace 'a' from *S1* with 'b' so that *S1* = "xbxb".

### CANDIDATE ANSWER

Language used: C

```
1
2  /*
3   * Complete the 'anagram' function below.
4   *
5   * The function is expected to return an INTEGER.
6   * The function accepts STRING s as parameter.
7   */
8
